

Application and Browser Extensions

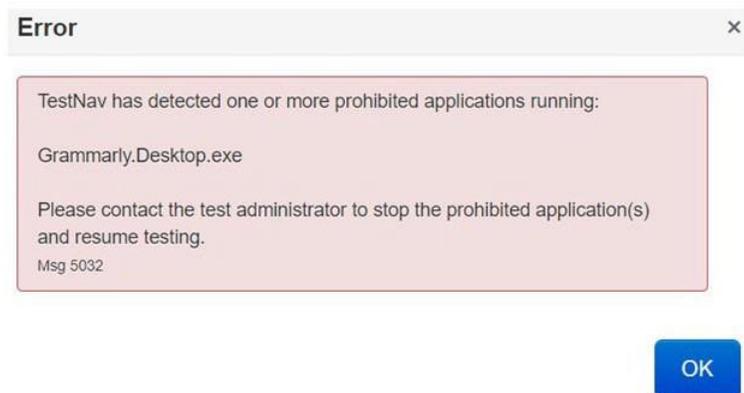

Please be advised that the TestNav application will be capable of detecting applications/extensions on devices used for the KSA. Please note that applications/extensions that run in the background of the device's operating system or browser can provide a testing advantage for students who use these extensions. All these applications/extensions must be disabled prior to taking the KSA.

App Check

Individual devices may be checked by running TestNav and selecting App Check in the drop-down menu in the upper right-hand side of the sign in page. The App Check will provide a notification if it finds an active application or extension on that device.

If the application/extension is active on a device and a test session is attempted, the following error will be displayed (see below). The TestNav session will not continue until the application/extension is disabled or removed.

Chrome OS/Chromebooks/Chrome OS Devices

Because TestNav is operated in the “Kiosk-mode” during testing, only the TestNav application is operational. The application/extension is automatically disabled in the Kiosk-mode and no additional actions are required for Chrome OS/Chromebooks/Chrome OS Devices.

Apple Devices (Desktop/Laptop/iPad)

The application/extension must be removed and/or disabled from the Apple device and all browsers running on that device. The application may be removed manually or through your desktop management system. Browser extensions must be disabled for all browsers that are installed on that device.

Windows Devices

Applications/extensions must be removed and/or disabled from the Windows devices and all browsers running on that device. The application may be removed manually or through your desktop management system (for example: SCCM or In-Tune). Browser extensions must be disabled for all browsers that are installed on that device. You may also consider using Group Policy to enable a Software Restriction rules to disable the browsers for your student users.
